

# Version Control using Git

# Coding

- All the design and thinking get transformed to an implementation.
- The main outcome is the code
- Software Engineer Vs Programmer

# Need for Version Control

```
void drawPicture() {  
    drawCircle();  
    for (int i = 0; i < 10; i++) {  
        drawTriangle();  
    }  
}
```

```
void drawPicture() {  
    drawCircle();  
    for (int i = 0; i < 10; i++) {  
        drawTriangle();  
    }  
}
```

```
void drawPicture() {  
    drawCircle();  
    for (int i = 0; i < 100; i++)  
    {  
        drawSquare();  
    }  
}
```

# Need for Version Control

# Git

- Most widely used version control system
- Developed by Linus Torvalds in 2005
- Git is an example of Distributed Version Control System (DVCS)

# Setting up a new Repository

To create a new repository for your new project

Project path: /home/user/projects/sample\_proj

```
cd /home/user/projects/sample_proj  
git init
```

This will initialize git and a `.git` folder will get created inside the project path

# Setting up a new Repository: Config

Config is to get or set global properties for the repository

```
git config --global user.email "you@example.com"  
git config --global user.name "Your Name"
```

# Setting up a new Repository

# Git status

To know the state of the files

```
git status
```

```
On branch master
```

```
No commits yet
```

```
Untracked files:
```

```
(use "git add <file>..." to include in what will be committed)
```

```
test.c
```

```
nothing added to commit but untracked files present (use "git add" to track)
```

# States of a file

**Untracked:** When a new file is created it is untracked

**Staged:** A staged file is ready to go into the local database during the next commit

**Unmodified/Committed:** the file is safely stored in the local git database.

**Modified:** file is has changes which are yet to be committed

# Existing Repository

```
git clone <repo url>
```

Git supports a few different network protocols (http, ssh etc.)

```
git clone https://github.com/linux-test-project/ltp.git
```

After cloning, all the files in the repository are in unmodified/committed state.

```
On branch master
Your branch is up to date with 'origin/master'.

nothing to commit, working tree clean
```

# Staging the files

Staged files get committed in the next commit

```
git add
```

```
On branch master

No commits yet

Changes to be committed:
  (use "git rm --cached <file>..." to unstage)
        new file:   test.c
```

# How to Commit?

- When a file is committed, it becomes a part of the local repository.
- All the staged files get committed

```
git commit -m <commit message>
```

```
git commit -m "first commit"
```

```
[master (root-commit) 44329c7] first commit
